Vol. 12, No. 36

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED SEPTEMBER 7, 1963

POLIOMYELITIS - Eight cases of poliomyelitis, seven paralytic, were reported during the week ending September 7. For the year, 237 cases have now been reported, less than half the number reported during a comparable period last year. Pennsylvania with 73 cases and Alabama with 39 cases account for 47% of the total.

Of the four cases reported from Alabama this week, two are unvaccinated children from Lawrence County where on August 24 a mass oral immunization program was conducted; the others are from neighboring Blount and Morgan Counties.

In Grand Rapids, Michigan, three paralytic cases of poliomyelitis have occurred among unvaccinated preschool

age children with onsets on August 10, 27, and 28. Type I poliovirus has been recovered from two of these cases. Utilizing, in part, vaccine from the CDC epidemic reserve, a mass oral poliomyelitis vaccine program will be initiated by early next week.

In Philadelphia, where 42 cases have been reported to date, an intensified immunization program was begun on September 11 in the city's twelve health centers, utilizing vaccine from the CDC epidemic reserve. On September 22, a community-wide program will be undertaken which will include 3,500,000 persons in Philadelphia and adjacent Bucks, Delaware, and Montgomery Counties, Pennsylvania and Camden County, New Jersey.

Table 1. CASES OF SPECIFIED NOTIFIABLE DISEASES: UNITED STATES

(Cumulative totals include revised and delayed reports through previous week)

| Disease | 36th Week | | | Cumulative | | |

| Plague: | - | Typhus, murine: | 15 |

VIRAL HEPATITIS
CHILDHOOD AND ADULT ATTACK RATES
AND ADULT/CHILDHOOD ATTACK RATE RATIO
BY WEEK - 1963

HEPATITIS – Hepatitis attack rates for each of the two age groups (under 20 and over 20), as well as the ratio of the adult to childhood cases, through the 33rd week are shown in the accompanying figure.

The childhood rate reached its peak during the week ending January 25, while the maximum adult rate was not attained until the week ending March 8. Both rates reached their seasonal low simultaneously in the week ending July 6, 1963.

As in previous years, the childhood rate has varied considerably in contrast to the adult rate which has remained relatively constant over the entire period. As a result, the ratio of adult to childhood attack rates varies as an inverse function of the childhood rate. As seen previously, the seasonal fluctuation in the incidence of viral hepatitis is primarily a reflection of swings in the rate of hepatitis in the younger segment of the population.

EPIDEMIOLOGICAL REPORTS

Dengue Fever – Puerto Rico

A total of 7,589 cases of dengue fever had been officially reported to the Commonwealth Department of Health as of noon, September 10. (See MMWR, Vol. 12, pp. 278, 286.) Of the total, 3,426 were reported during September. Of the 77 *municipios* on the island, 48 have now reported cases, 17 of these for the first time during the past week.

Outbreaks consisting of 250 or more officially reported cases have been recognized in 8 *municipios*, as shown in the table (right).

It is believed that the disease incidence is considerably under reported and may well be present in other areas not yet reporting cases.

| Municipio | Population* | Reported Cases Through September 10 |
|-------------|-------------|--|
| Arecibo | 69,879 | 1,225 |
| Barceloneta | 19,334 | 1,100 |
| Guayama | 33,678 | 489 |
| Juncos | 21,486 | 688 |
| Manati | 29,354 | 1,141 |
| Morovis | 18,094 | 394 |
| Rio Piedras | 251,384 | 372 |
| Vega Baja | 30,189 | 489 |

*1960 census

Preliminary analysis of a detailed morbidity survey carried out in the township of Guaynabo, eight miles south of San Juan, reveals an attack rate for dengue-like illness of 9.8%. Attack rates are somewhat higher among those in the 40 to 59 year age groups, but are generally remarkably similar for all ages.
